EXAMINER'S AMENDMENT

I. An Examiner's amendment to the record appears below. Should the changes and/or additions be unacceptable to Applicant, an amendment may be filed as provided by 37 CFR 1.312. To ensure consideration of such an amendment, it MUST be submitted no later than the payment of the issue fee.

IN THE CLAIMS:

A) Please amend claims 1 and 20 as follows:

1. (Currently Amended) Stereoscopic device comprising:
at least two apertures, each of said apertures including a light valve, each of said light valves being operative to open at a different predetermined timing;
a multi wavelength light sensor array comprising a plurality of sensors, wherein each of the plurality of sensors is a multi wavelength sensor, and
a controllable multi wavelength illumination unit illuminating a scene, said controllable multi wavelength illumination unit producing at least two separated alternating beams of light, each said beams of light characterized as being in a different range of wavelengths,
a controller connected to said light valves, said multi wavelength light sensor array, and to said controllable multi wavelength illumination unit, said controller coordinating the timing and the operation of said light valves, with said controllable multi wavelength illumination unit, and with said multi wavelength light sensor array, to detect a plurality of images, so that for each of said plurality of images, only a single one of said light valves exhibits an open state and only one of said at least two separated alternating beams of light illuminates the detected scene.

Art Unit: 2621

20. (Currently Amended) Method for detecting a stereoscopic image comprising the steps of:

providing light valves alternating between at least two apertures, directed at an object;

providing a controllable multi wavelength illumination unit producing a sequence of at least two separated illumination beams, at different ranges of wavelengths;

controlling the operation of said at least two apertures and the sequence of said at least two separated illumination beams, such that for each said image, only a single one of said apertures exhibits an open state and only one of said at least two illumination beams illuminates the detected scene;

providing a multi wavelength light sensor array comprising a plurality of sensors, wherein each of the plurality of sensors is a multi wavelength sensor, the sensor array detecting a plurality of frames, controlling the timing of the operation of said light valves, and coordinating the timing of the operation of said light valves with operation of said controllable multi wavelength illumination unit to detect the plurality of frames for a combination including a selected open one of said apertures and at least a selected illuminating one of said beams.

REMARKS:

II. Claims 1 and 20 have been amended as discussed above, as authorized by Applicant's attorney, Gregory A. Sebald (Reg. No. 33,280) on 8/16/06.
